# SMALL BUSINESS

## Small business solutions

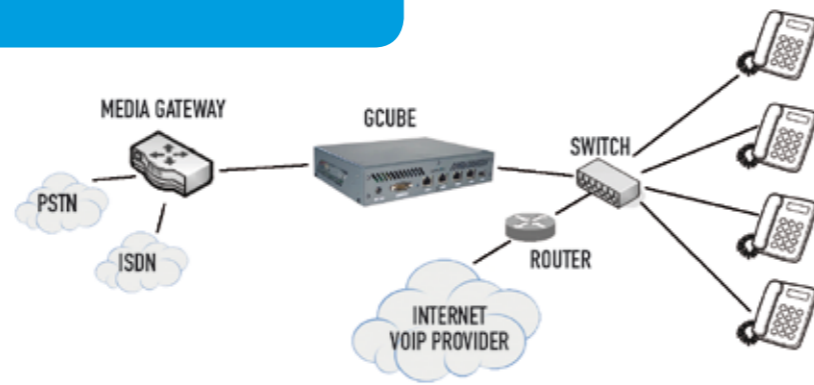

GCUBE is the ideal system to manage communication in small and medium businesses. Its graphical interface will also allow less experienced system administrators to implement many functions in IP telephony and perimeter security.

In fact, GCUBE is a central unit from which all policies correlated to business telecommunication functions can be managed comprehensively in a simple and secure manner, through the following modules:

**Firewall:** manages peripheral security protecting the business network from intrusions and unauthorized accesses.

**VPN:** allows secure connection of different sites over the Internet. It also allows you to access the corporate network via mobile devices such as palmtops, PDAs, smartphones and tablets.

**VOIP:** the Voice over Internet Protocol is the evolution of the traditional telephone system. In addition to the standard functions of the old analogue systems it provides a virtually unlimited amount of new services that can be implemented through IVRs. The IP system also allows you to save money using VOIP telephone channels through the Internet and reduces the cost of telephone calls between branch offices to a simple line fee

ensuring free calls.

**Fax server:** A fax device is still essential for a company. GCUBE also digitalizes this tool and allows faxing documents as email. With this dedicated client, that is available for all platforms, you can send faxes directly from your desktop.

The system includes a centralized Address List that can be filled in and browsed on the web and allows the IVR system to make decisions according to the number of the caller and to display the caller's name. The system is continuously updated via the internet in order to ensure total security for your business.

# HOTEL

We have particular attention to hotels and accommodations. Our system consists of a IP PBX and a hotspot module for internet access specifically designed for hotels and for your guests.

The PBX system is designed to make your life easier by automating the "enabling and disabling" of the phones of your hotel by connecting directly to your preferred management software without adding additional work to the receptionist.

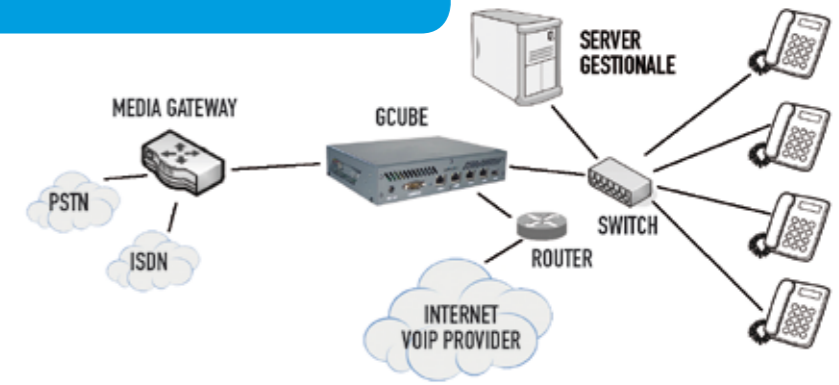

In this way, as soon as one of your guest will be "check in" the system will enable outgoing calls on the phone in the room and if you need it will also activate the guest's internet wifi access.

Telephone calls and internet traffic will be send to your management software allowing you to completely forget about the management of mobile wifi access and phones of your hotel.

When the guest ask you to checkout you will have all the amounts loaded onto your management software that will prepare the final bill.

In addition to the normal features of a voip PBX we have created specific features to simplify the management of your hotel that can be used by your staff via phones keypad, the data collected will automatically transmitted into the management software:

**Room status:** Inform the front desk if the room is clean, dirty, if it is down for maintenance or if the staff is still room for cleaning.

**Management of minibar charges:** Notify through specific codes if there were drinks in the minibar automatically sending the charge to your management software.

**Wake Up Service:** Automatically call the room number at a preset time with ability to set the recurrence for the duration of guest stay. This function can be set both via your management software or by phone directly from the guest.

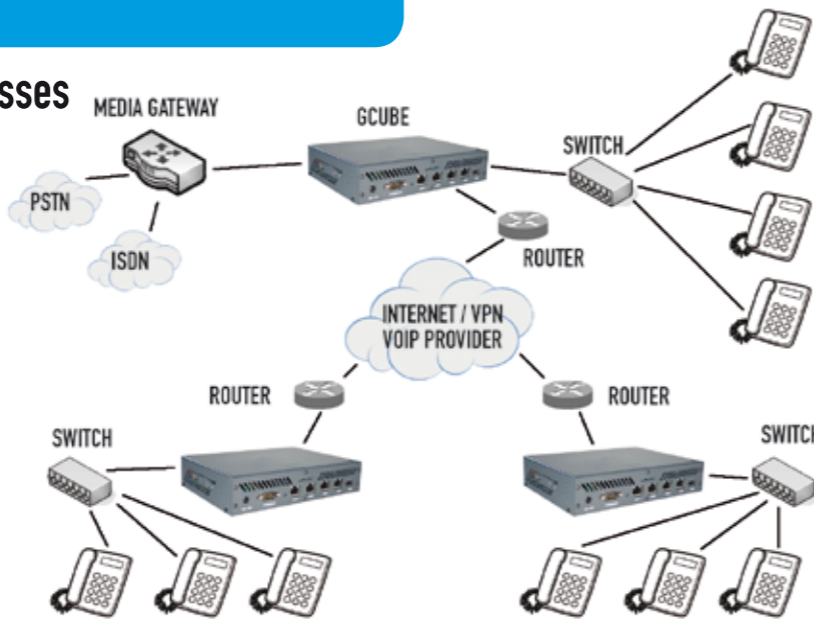

If your hotel haven't a management software, all these functions can be managed from a web console included in the system price that will allow you with a few clicks (also from Tablet and Touch Screen) to enable and disable the phones in the rooms, to enable and disable the wifi guest access and generate reports containing all telephone, internet and minibar charges.

# ENTERPRISE

## Solutions for medium and large businesses

For a large business communication is crucial. With GCUBE you can manage your business communication and security optimally by interconnecting the different subsidiaries via data transfer and phone connection. The Professional and Enterprise versions, in addition to the characteristics available in the Small Business version, implement some basic functions that ensure business continuity through system redundancy.

In fact, two appliances performing the same functions can be switched on simultaneously. If one system should stop working, the other one takes over automatically and performs the entire job without interrupting the service. The Professional and Enterprise versions are provided with oversized hardware to provide you with top performance and scalability in future function implementations.
